Perl is a high-level, general-purpose, interpreted, dynamic programming language. It is often described as "modular programming language," which means it contains several powerful features that make writing and maintaining Perl programs fast and easy. In addition to these features, Perl is easy to learn, fun to use, and an excellent general-purpose programming language. Perl is a dynamic language, meaning you can change your program while it is running. Perl is also very versatile. It can be used for a wide variety of programming tasks including database programming, system administration, web programming, text processing, and any other programming task you can think of. Perl programs are human-readable source code files that use a special coding language called the "Perl language." Perl interpreters read the Perl source code files and execute the code as it is written. Perl is a good language for learning as it is relatively easy to read and very simple to use. It requires very little learning to write and is very fun to use. The good news is that Perl is always changing and will continue to change as the years go by. Perl comes with a full array of tools and libraries to help you create and run programs. Perl comes with a lot of support on Windows, Mac OS X, and Linux. Many people think of Perl as only a programming language. While Perl is a very powerful language, Perl is also used as a scripting language. Perl is designed for use in a variety of programming applications and also for use as a general-purpose programming language. Perl allows you to create scripts for a variety of tasks, including system administration, web page maintenance, or even general programming. Additional Perl-related tools include: perlbrew, perl-x, y, and z. The following Perl related tools are included: perl-bin This is the Perl binary distribution of Perl on most Unix-like systems. You will find this binary in your /usr/bin directory. It contains the language interpreter, the module/library manager, and the CPAN module system. perl-dev This is the Perl development package on most Unix-like systems. It contains a development distribution of Perl with the modules, the libraries, the header files, the CPAN, and more. perl-lib This is the Perl library distribution on most Unix-like systems. You will find this package in your /usr/lib directory. It contains the core Perl library and some other modules. perl
